On the vaccine trail in Germany

'Mittelstand' companies, manufacturing and logistics experts prove crucial

BERLIN: It was over breakfast on the wintry morning of Jan 24 that Ozlem Tureci and her husband Ugur Sahin decided, "we need to fire the starting gun on this". Sahin "had concluded from a publication describing coronavirus cases in Wuhan... that there was a high probability that a pandemic could be imminent", Tureci recounted. The decision by the couple, founders of a small German company called BioNTech, gave birth to Operation Lightspeed - in which the scientists in the company diverted all their resources from cancer therapy research to finding a vaccine to stop COVID-19.

"Since that day... there has not been a day when we took a break from working on this project," said Tureci. Four days later, on Jan 28, Germany confirmed its first case of coronavirus infection - also the first known human-to-human transmission on European soil. What was an epidemic hitting China hardest soon morphed into a global health crisis, forcing governments to close borders, schools and offices and keep their populations at home to halt the spread.

As BioNTech and other pharmaceutical companies leapt into action in search of the winning formula, Germany's army of "Mittelstand" companies and other bigger manufacturing and logistics experts would soon prove crucial.

Genie in a bottle

Just a few minutes' drive away from BioNTech's headquarters in the city of Mainz, one such company quietly ramped up production. Little known to the rest of the world, the 130-year-old firm Schott is in fact a major player in the

pharmaceutical industry because of its little glass vials designed to hold life-saving vaccines. Three-quarters of the more than 100 coronavirus inoculation trials across the world would end up using Schott products.

The company alone aims to produce enough vials to hold two billion doses of a coronavirus vaccine by the end of 2021, head of communications Christina Rettig told AFP. Schott itself had an early scare with the virus at its Mitterteich plant in Bavaria. The town became one of Germany's first coronavirus hotspots in March after a beer festival, and Rettig said several Schott workers from the Czech Republic ended up "not seeing friends and family for weeks" as borders slammed shut.

Freight steps up

With passenger flights mostly grounded, the buzz at Frankfurt airport's terminals all but vanished to a hush in the spring. Its freight area however kept humming. Tens of thousands of boxes of urgently needed surgical gowns and masks were transiting through. The head of freight infrastructure at Fraport, Max Philipp Conrady, knew that was just the beginning for his division in the pandemic battle.

No one knew then which company would find a vaccine or when it would be ready, but Frankfurt is already Europe's largest hub for transporting pharmaceutical goods. And so planning had to begin for the unprecedented logistical challenge of transporting millions of life-saving vaccine doses worldwide. Fraport's vast temperature-controlled hangar handled 120,000 tons of vaccines, drugs and other pharmaceutical

products in 2019. The operator anticipated the demand for cold storage, and boosted investments in high-tech refrigerated "dollies" that would do the transporting from hangars to planes. It now has 20, so several freighters can be loaded at the same time.

Cold is hot

Fraport was not the only one upping investments in solutions to keep things cool. As it became clear that BioNTech's vaccine would need to be stored at minus 70 degrees Celsius the expertise of cold chain management became the next hot commodity in town. Amid the global scramble to solve the problem of keeping vaccines at the right temperature as they get transported across the world, it would appear that there is a German company for every obscure application.

Binder in Tuttlingen has its "super freezers" which were already tapped as early as March to chill coronaviruses used in laboratory research by BioNTech and another German vaccine developer, CureVac. But demand further grew as BioNTech advanced in the race. "It started really in August, when we received these requests from logistics companies... they knew we must fit our cold storage... with freezers in order to distribute the vaccines around the world," said Binder spokeswoman Anne Lenze.

While Binder ensured static refrigeration of up to minus 90 degrees, another company Va-Q-Tec makes moving boxes with an ultra-cool function for the actual transportation process. Using a silica particle technology, the containers can maintain temperatures ranging from

one similar to a fridge to polar chills for up to 10 days "without the need for energy input", chief executive Joachim Kuhn told AFP.

On Nov 18, BioNTech and its partner Pfizer finally announced that their Phase III study showed around 95 percent efficacy against the virus. The news sent stock markets into euphoria and was hailed as a watershed, a light at the end of a very long, dark tunnel. By then, the logistics sector was raring to go. As Fraport's Conrady put it: "We've been ready since August."

'Champagne isn't our thing'

Celebrating in their understated manner, BioNTech's founders knew it was too early to rest on their laurels. "Champagne is not our thing. We sat

down and enjoyed a cup of tea and used the time to reflect on what had happened so far and what will come next," Sahin told AFP. Several hundred kilometers away in the German capital, 66-year-old Albrecht Broemme was placing a bunch of Lego figurines here and there as he visualized how to transform Berlin's old airports into centers for the unprecedented vaccination drive.

An ex-firefighter and former head of civil protection agency THW, Broemme had been called out of retirement to help in the pandemic battle. Early on, he was pivotal in designing emergency sites in case patient numbers were to soar above hospital capacities. In the autumn, he was tapped again to conceptualize the vaccination drive for the German capital. — AFP

JCI REACCREDITED TAIBA HOSPITAL FOURTH TERM IN A ROW

We are proud to end this year with a reaffirmation of our standard of excellence in healthcare by the Joint Commission International Accreditation (JCIA). In addition, our Orthopedic Department received their Second recertification by JCIA as Centre of Excellence for "Total knee Replacement and Lumbar Decompression and Fixation" program.

Taiba Hospital... a Decade of continuous excellence.
